

OPINION

After one year of observations, it is this author's opinion that earthquakes are not caused by tectonic plate stress, pressure, overlap, movement and activity as professed globally by modern scientists of the common era, but rather by massive explosions occurring deep within the internal structure of the earth at such awesome power and magnitudes that they create the force needed to move tectonic plates making it appear as if tectonic plate movements and overlap cause earthquakes. These massive internal explosions find release and expression at atmospheric induced voids located near tectonic plate intersections.

In this regard, earthquakes are caused by internal combustive explosions that are gathered, housed, honed, triggered and ignited by eclipses, earth-surface phenomena and events such as tornadoes and hurricanes as well as ocean and sea movement vis-à-vis Sun-Moon events and relationships, lunar, solar, (including Sun spots) and cosmic events as well as planetary influences, especially with respect to Mars (initiator of earthquakes), Neptune, Jupiter, Saturn and Mercury. Uranus plays a role in triggering earthquakes but do not cause them. Hence, earthquakes are predictable within a certain level of confidence.

It is also this author's opinion, that the work done by Dr. Jacek Dunajewski of Poland entitled, [The Dunajewski Effect: The Nature of Earthquakes](#), might be the best explanation we have today describing the cause and nature of earthquakes on Mother Earth.
